

Hi All,

Firstly thank you for joining the MINI CHALLENGE for the 2019 season, working throughout last year I have put together a few things for this season to hopefully make the data side of things more accessible for all the teams.

Secondly, it is imperative that your Toolbox, Toolset and Dashboards are kept up to date with the latest firmware from Cosworth. A lot of issues experienced last year, from inaccessible data, to dashboard errors and setup faults could have all been negated by ensuring they are all up to date. Please see links below:

<https://www.cosworth.com/products/toolset/>

<https://www.cosworth.com/products/toolbox/>

Please see below for changes to the 2019 season to help aid teams and drivers get the most out of the software capabilities of the cars.

1. Previously a screenshot could be made available to show the fastest lap time of the session by coming to the data engineer with a memory stick. To make this process more efficient, fastest lap data (via a screenshot) will be uploaded to the following location:
<https://drive.google.com/open?id=17598mTGnHvo6e4PUNrKvyTtEbScRj7rW>
With the same channels as previous: Brake Pressure, Pedal Position, RPM, Speed and Gear Position. Please check this shortly after a session ends.

For those wanting to carry out direct analysis to the screenshot, please find an example Toolbox Template uploaded to the drive at the following location:
<https://drive.google.com/open?id=1IN9WnxQF09UcD11Ka8TVP4WFzjk1gZP>

2. To help teams self-diagnose faults with their vehicles I have also developed an engine diagnostics workbook with many targets vs actual readouts for a range of engine parameters. I suggest that this workbook is used to look at running data from last year as well as what is observed this year to make comparisons with 'good running' and perceived 'bad running'. With the grids being even fuller this year, it will simply not be possible for me to look at every single lap, for a certain engine parameter where I have been told that you have an issue with a car to help diagnose. I will be dependent on yourselves assessing your own data and making conclusions where I hope to be able to confirm perceived poor running and potential solutions where you have concisely highlighted the issue and have everything loaded for me to view. I am here to help but want to be transparent and evenly shared through the entire entry list.
3. Finally, to assist driver manage temperatures to maintain optimum engine performance, we would like to suggest incorporating 'Air Temperature' and if applicable 'Gearbox Temperature' on page one of the dashboards. Please check your data to see if you have TGearbox channel reading reliable data. Some vehicles don't have TGearbox channel available due to wiring loom changes (early builds and other variants).

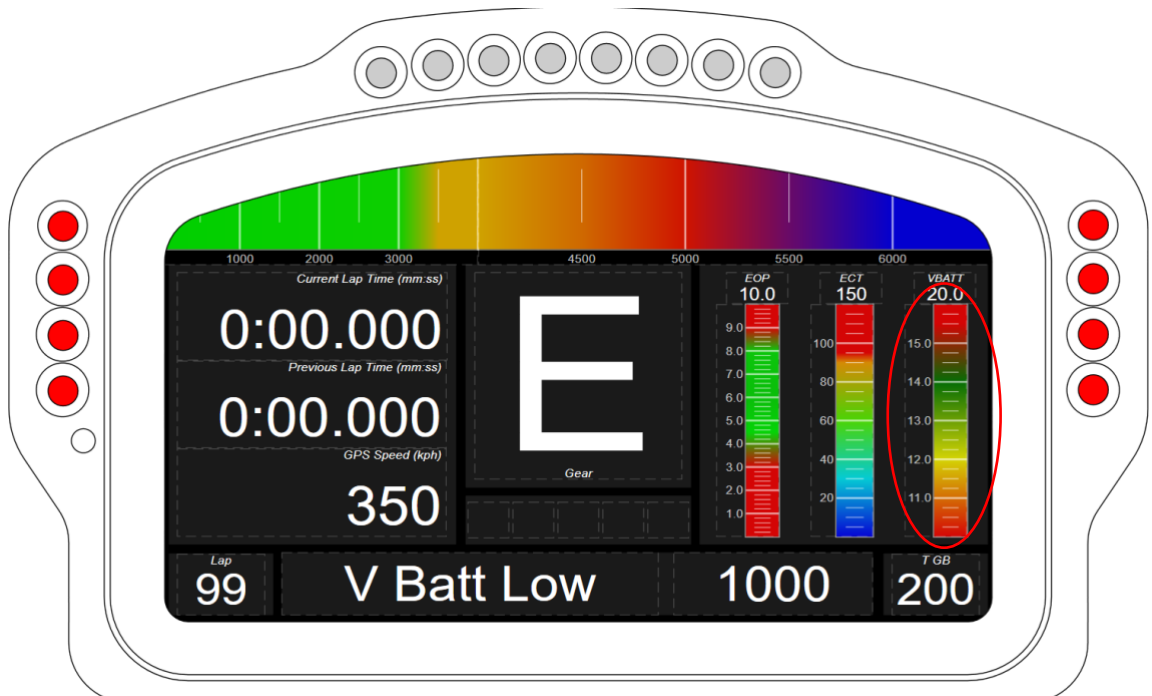

Please see below how to add 'Air Temperature' only to your dashboard if you do not have Gearbox Temperature data (method to add both Gearbox Temp and Air Temp following).

We suggest removing (or moving to page two) a lesser priority readout, in this example I use battery voltage (as I have a duplicate on page two).

- a. Open Toolset, navigate to the setup you wish to modify, and open 'Display Settings'.

- b. Click the colour readout bar and apply the numbers outlined in the screenshots following:

Bar Control (RightGauge3) Properties

Channel

Source

Quantity Unit

Decimal Places Color

Display Minimum Maximum

Alarm Minimum Maximum Enabled

Filter Period ms

Filters channel values over the specified period (0 = no filtering).

Match Template Reset the channel properties to match the current display's template.

Appearance

Orientation

Text

Fill Mode Fill Relative To
 Needle

Label Color Override

Alarm Color Override

d. Setup should look similar to the following:

To add Gearbox Temperature and Air Temperature to your dashboard you will need to apply a different display template to the dash.

- a. Open up the display settings as per the instructions above.
- b. On Race Page 1, select the 'pencil button' and on the properties tab press the 'pencil button' again. You can now select the template 'COS_V1_Race_A_04'.

- c. This should introduce a new bar gauge to the setup. It should also carry over all the channels and warnings, but please check the values against old setups to confirm that these are correct.

- d. Now to add Gearbox Temperature variables to the additional bar that will have appeared the same way we added IAT variables earlier in the guide. Please apply these variables for the bar itself:

Channel

Source

Quantity Unit

Decimal Places Color

Display Minimum Maximum

Alarm Minimum Maximum Enabled

Filter Period ms

Filters channel values over the specified period (0 = no filtering).

Match Template *Reset the channel properties to match the current display's template.*

Please check for errors (RHS of toolset) and rectify these before applying setups to your dashboards to negate all errors.

Thanks all, I hope for a successful and enjoyable 2019 season!!

Zac
